5. Face following

5.1. Experimental Objectives

In this class, we will start to implement face tracking with the camera gimbal. By identifying the face object and detecting the difference between the x, y coordinates of the circumscribed circle of the identified face and the center of the screen, the PID algorithm is used to control the Y-axis servo and the vehicle body to make the identified target located in the center of the screen

5.2. Experimental Code

5.3. Experimental Phenomenon

After the code block is run, we put a face in front of the camera. After the camera recognizes the face, it will control the Y axis of the gimbal and the body to move in the direction of the face.
